Dopamine - Glutamate Interactions in the Basal Ganglia Susan Jones, 2011-12-14 The basal ganglia are involved in complex brain functions from voluntary movement control to learning and reward processing and they are implicated in numerous neurological and psychiatric disorders Information from the cerebral cortex and thalamus is conveyed to basal ganglia nuclei via glutamate release while dopamine from the midbrain is released in close proximity to glutamate At the heart of both function and dysfunction of basal ganglia circuits is the interaction of these two neurotransmitters dopamine and glutamate Elucidating the relationship between their molecular and cellular effects and behavioural significance has been challenging but in the past 5 10 years improved labeling imaging recording and genetic manipulation approaches have yielded new information on how dopamine and glutamate interact to generate the circuit activity underpinning basal ganglia function Dopamine Glutamate Interactions in the Basal Ganglia synthesizes this recent research from the level of receptor molecules all the way to complex behaviours and disease Current insights from research on individual neurons and synapses detailed circuit analysis and learning and action functions of the basal ganglia are presented against a historical perspective The book also discusses compromised dopamine glutamate interaction in disorders of basal ganglia function including Parkinson s disease Huntington s disease and drug addiction *Dopamine - Glutamate Interactions in the Basal Ganglia*

Human Brain using Magnetic Resonance Imaging and Spectroscopy with Transcranial Direct Current Stimulation

Chang-Hoon Choi, Jon Shah, Ferdinand Binkofski, 2025-01-02 A large body of molecular and neurophysiological evidence attaches synaptic plasticity and connectivity to specific functions and energy metabolism in particular areas of the brain A

favourable approach to investigating various brain functions in humans that enables a well defined modulation of neuronal excitability and energy is to stimulate the brain using a dedicated transcranial direct current stimulation tDCS protocol and then to observe the effect on neurometabolites and brain functioning using magnetic resonance spectroscopy and magnetic resonance imaging tDCS is a non invasive technique for brain stimulation that modulates the level of cortical excitability hyper or hypo polarisation of the membranes to investigate the biochemical and physiological roles of the brain The technique is also utilised for clinical and therapeutic purposes such as depression chronic pain epilepsy stroke induced aphasia or Parkinson s motor symptoms and can also be used to boost ongoing activities including accelerated learning focus memorisation or relaxation
