

Chapter 4: Geologic Time

Remember that geologists use two "languages of time": **Relative time** and **absolute time**. **Relative time** is the study of the order and extent of geological processes to give an approximate picture of the sequence of events. It is important to recognize that **geological time** is not the same as **calendar time**. The order of geological events is not the same as the order of events in a calendar. It is possible that several things in all geologic time could be the same as in a calendar. For example, the order of geological events is not the same as the order of events in a calendar. It is possible that several things in all geologic time could be the same as in a calendar. For example, the order of geological events is not the same as the order of events in a calendar.

A. Relative dating

There are two methods of relative dating: **stratigraphy** and **structural geology**. **Stratigraphy** is the study of the order and extent of geological processes to give an approximate picture of the sequence of events. It is important to recognize that **geological time** is not the same as **calendar time**. The order of geological events is not the same as the order of events in a calendar. It is possible that several things in all geologic time could be the same as in a calendar. For example, the order of geological events is not the same as the order of events in a calendar.

Principles for Relative Dating

1. Principle of Original Horizontality

This principle states that sediments are deposited in horizontal layers. If the layers are tilted, they have been tilted after deposition. This is the basis for relative dating. It is possible that several things in all geologic time could be the same as in a calendar. For example, the order of geological events is not the same as the order of events in a calendar.
